

**AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims**

1. (Currently Amended) A modular fluid casing, comprising:  
a housing having an inlet end and an outlet end and defining a flow channel therebetween formed by sidewalls and a bottom wall of the housing, the flow channel in fluid communication with said inlet end and said outlet end; ~~and~~  
a modular cage removably secured to said housing, said modular cage having a first open end and a second open end and defining an interior cavity, said modular cage received within the flow channel of said housing, wherein the interior cavity of said modular cage is in fluid communication with said inlet end and said outlet end and said flow channel of said housing, and wherein said modular cage is a one-piece non-movable construction; and  
wherein at least one check valve is seated within the interior cavity of said modular cage.
2. (Previously Presented) The modular fluid casing as claimed in claim 1, wherein said at least one check valve is removably seated within the interior cavity of said modular cage, wherein said check valve is in fluid communication with said inlet end and said outlet end of said housing.
3. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein said modular cage is tubular shaped.
4. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein said second open end of said modular cage is capable of receiving said check valve.
5. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein at least one fluid seal is positioned between said housing and said modular cage for fluidly sealing said modular cage within the flow channel of said housing.

6. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein said modular cage comprises a first gasket positioned adjacent said first open end and a second gasket positioned adjacent said second open end of said modular cage for fluidly sealing said modular cage within the flow channel of said housing.

7. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein said modular cage further comprises at least one tap in fluid communication with the interior cavity.

8. (Previously Presented) The modular fluid casing as claimed in claim 2, wherein said housing defines at least one lug extending outwardly from an outer surface of said housing, said lug defining an orifice adapted to receive a fastener.

9. (Previously Presented) The modular fluid casing as claimed in claim 8, further comprising a fastener, wherein said modular cage defines at least one protrusion extending outwardly from an exterior surface of said modular cage, said protrusion having a slot aligned with the orifice of said lug of said housing, whereby said fastener passes through the orifice and the slot for securing said modular cage to said housing.

10. (Withdrawn) The modular fluid casing as claimed in claim 2, wherein said modular cage is removably secured to said housing via a retainer attached to an external clamp.

11. (Currently Amended) A check valve arrangement, comprising:  
a housing having an inlet end and an outlet end and defining a flow channel therebetween formed by sidewalls and a bottom wall of the housing, the flow channel in fluid communication with said inlet end and said outlet end;

a modular cage removably secured to said housing, said modular cage having a first open end and a second open end removably seated within the flow channel of said housing, said modular cage defining an interior cavity, the interior cavity defining a first diameter portion and a second diameter portion, and wherein the interior cavity of said

modular cage is in fluid communication with said inlet end and said outlet end and said flow channel of said housing, and wherein said modular cage is a one-piece non-movable construction; and

a plurality of check valves removably seated within the first diameter portion and the second diameter portion of the interior cavity of said modular cage, wherein said check valves are in fluid communication with said inlet end and said outlet end of said housing.

12. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein a lip separates the first diameter portion from the second diameter portion of the interior cavity.

13. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein the first diameter portion and the second diameter portion of the interior cavity of said modular cage have the same diameter.

14. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein the first diameter portion has a diameter less than a diameter of the second diameter portion of the interior cavity of said modular cage.

15. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein the first diameter portion of the interior cavity holds one of said check valves in place within said modular cage.

16. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein at least one fluid seal is positioned between said housing and said modular cage for fluidly sealing said modular cage within said flow channel of said housing.

17. (Previously Presented) The check valve arrangement as claimed in claim 11, further comprising a first gasket positioned adjacent said first open end of said modular cage and a second gasket positioned adjacent said second open end of said modular

cage, wherein said gaskets provide a fluid seal between the interior cavity of said modular cage and said inlet end and said outlet end of said housing.

18. (Previously Presented) The check valve arrangement as claimed in claim 11, further comprising a valve gasket positioned between an outer surface of each of said check valves and the interior cavity of said modular cage.

19. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein said modular cage comprises at least one tap in fluid communication with the interior cavity.

20. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein said modular cage comprises a tap for each check valve seated within the interior cavity of said modular cage.

21. (Withdrawn) The check valve arrangement as claimed in claim 11, wherein said modular cage is removably secured to said housing via a retainer attached to an external clamp.

22. (Previously Presented) The check valve arrangement as claimed in claim 11, further comprising a fastener removably securing said housing to said modular cage.

23. (Previously Presented) The check valve arrangement as claimed in claim 11, wherein said housing defines at least one lug extending outwardly from an outer surface of said housing, said lug having an orifice adapted to receive a fastener.

24. (Previously Presented) The check valve arrangement as claimed in claim 23, further comprising a fastener, wherein said modular cage defines at least one protrusion extending outwardly from an exterior surface of said modular cage, said protrusion having a slot aligned with the orifice of said lug of said housing, whereby said fastener passes through the orifice and the slot for securing said modular cage to said housing.

25. (Cancelled)

26. (Previously Presented) A modular fluid casing, comprising:  
a housing having an inlet end and an outlet end and defining a flow channel therebetween, the flow channel in fluid communication with said inlet end and said outlet end; and

a modular cage removably secured to said housing, said modular cage having a first open end and a second open end and defining an interior cavity, said modular cage received within the flow channel of said housing, wherein the interior cavity of said modular cage is in fluid communication with said inlet end and said outlet end of said housing, wherein the interior cavity of said modular cage is adapted to receive at least one check valve, and wherein a wedged arrangement is formed between said second open end of said modular cage and an inner surface defined within the flow channel adjacent said outlet end of said housing, thus sealing said modular cage within the flow channel of said housing.

27. (Previously Presented) A check valve arrangement, comprising:  
a housing having an inlet end and an outlet end and defining a flow channel therebetween formed by sidewalls and a bottom wall of the housing, the flow channel in fluid communication with said inlet end and said outlet end;

a modular cage removably secured to said housing, said modular cage having a first open end and a second open end removably seated within the flow channel of said housing, said modular cage defining an interior cavity, the interior cavity defining a first diameter portion and a second diameter portion, and wherein the interior cavity of said modular cage is in fluid communication with said inlet end and said outlet end and said flow channel of said housing; and

a plurality of check valves removably seated within the first diameter portion and the second diameter portion of the interior cavity of said modular cage, wherein said check valves are in fluid communication with said inlet end and said outlet end of said housing, and wherein a wedged arrangement is formed between said second open end of said modular cage and an inner surface defined within the flow channel adjacent said outlet end of said housing, thus sealing said modular cage within the flow channel of said housing.

28. (Previously Presented) A modular fluid casing, comprising:  
a receiving member having an inlet end and an outlet end and defining a  
modular cage receiving area therebetween; and

a modular cage removably secured to said receiving member and received by  
the modular cage receiving area, said modular cage having a first open end and a second open  
end and defining an interior cavity, the interior cavity of said modular cage is in fluid  
communication with said inlet end and said outlet end of said receiving member, wherein the  
interior cavity of said modular cage is adapted to receive at least one check valve, and  
wherein a wedged arrangement is formed between said second open end of said modular cage  
and an inner surface defined within the modular cage receiving area adjacent said outlet end  
of said receiving member, thus sealing said modular cage within the modular cage receiving  
area of said receiving member.

29. (Cancelled)

30. (Previously Presented) A check valve arrangement, comprising:  
a receiving member having an inlet end and an outlet end and defining a  
modular cage receiving area therebetween;

a modular cage removably secured to said receiving member and received by  
the modular cage receiving area, said modular cage having a first open end and a second open  
end and defining an interior cavity, the interior cavity defining a first diameter portion and a  
second diameter portion, wherein a wedged arrangement is formed between said second open  
end of said modular cage and an inner surface defined within the modular cage receiving area  
adjacent said outlet end of said receiving member, thus sealing said modular cage within the  
modular cage receiving area of said receiving member; and

a plurality of check valves removably seated within the first diameter portion  
and the second diameter portion of the interior cavity of said modular cage, wherein said  
check valves are in fluid communication with said inlet end and said outlet end of said  
receiving member.

31. (Cancelled)

32. (Previously Presented) A method of installing check valves in line with respect to a fluid conduit using a modular fluid casing, the modular fluid casing includes a receiving member having an inlet end and an outlet end and defining a modular cage receiving area therebetween, and a modular cage having a first open end and a second open end and defining an interior cavity, wherein a wedged arrangement is formed between the second open end of the modular cage and an inner surface defined within the modular cage receiving area adjacent the outlet end of the receiving member, the method comprising:

- a. inserting at least one check valve into the interior cavity of the modular cage;
- b. inserting the modular cage into the modular cage receiving area of the receiving member;
- c. securing the modular cage to the receiving member; and
- d. installing the modular fluid casing in line with respect to a fluid conduit.

33. (Currently Amended) A The method as claimed in claim 25, of installing check valves in line with respect to a fluid conduit using a modular fluid casing, the modular fluid casing includes a housing having an inlet end and an outlet end and defining a flow channel therebetween formed by sidewalls and a bottom wall of the housing, and a modular cage having a first open end and a second open end and defining an interior cavity, the method comprising:

- a. inserting at least one check valve into the interior cavity of the modular cage;
- b. inserting the modular cage into the flow channel of the housing whereby the interior cavity of said modular cage is in fluid communication with said inlet end and said outlet end and said flow channel of said housing;
- c. securing the modular cage to the housing; and
- d. installing the modular fluid casing in line with respect to a fluid conduit.

Application No. 10/692,465  
Response to Office Action dated April 13, 2007  
Paper dated August 13, 2007  
Attorney Docket No. 1940-031320

wherein a wedged arrangement is formed between the second open end of the modular cage and an inner surface defined within the flow channel adjacent the outlet end of the housing, thus sealing the modular cage within the flow channel of the housing.
